| LL | LED life Time (Typical) | | 50,000 | 70,000 | -- | Hrs | (3) |

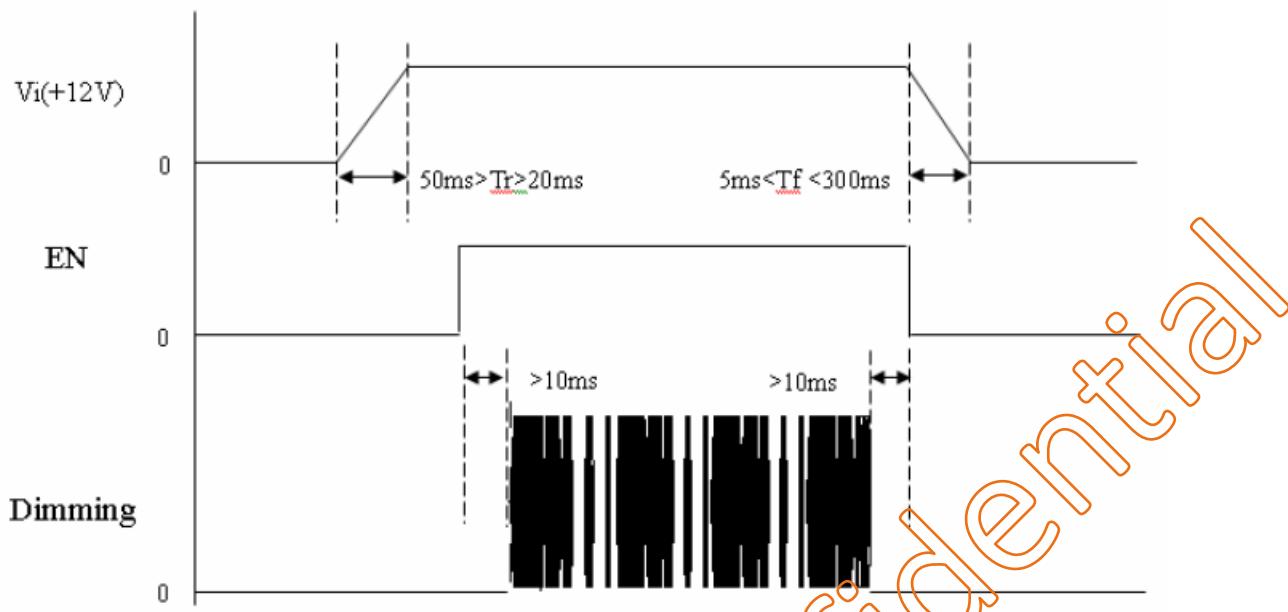

Note (1) LED current is measured by utilizing a high frequency current meter as shown below:

Note (2) At 20k Hz PWM control frequency, duty ratio range is restricted from 20% to 100%.

Note (3) The life time of LED is estimated data and defined as the time when it continues to operate under the conditions at Ta=25 ± 2 °C and Duty 100% until the brightness becomes ≤50% of its original value. Operating LED under high temperature environment will reduce life time and lead to color shift.

Power sequence and control signal timing are shown in the following figure

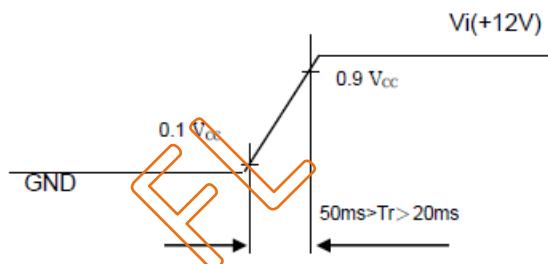

Note : While system is turned ON or OFF, the power sequences must follow as below descriptions

Turn ON sequence: $Vi(+12V) \rightarrow EN \rightarrow \text{Dimming}$

Turn OFF sequence: $\text{Dimming} \rightarrow EN \rightarrow Vi(+12V)$

4.1.2 Power ON/OFF Sequence

To prevent a latch-up or DC operation of LCD assembly, the power on/off sequence should be as the diagram below.

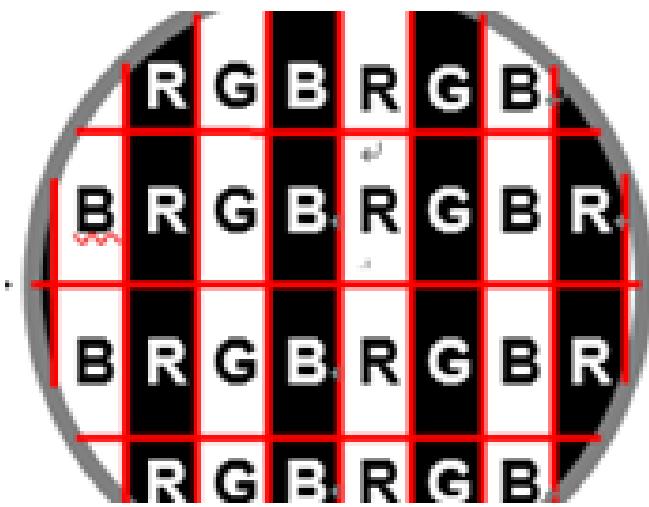

Note (1) Please avoid floating state of interface signal at invalid period.

Note (2) When the interface signal is invalid, be sure to pull down the power supply of LCD VCC to 0V.

Note (3) The Backlight converter power must be turned on after the power supply for the logic and the interface signal is valid. The Backlight converter power must be turned off before the power supply for the logic and the interface signal is invalid.

The following optical specifications shall be measured in a darkroom or equivalent state (ambient luminance <2 lux, and at room temperature).

The room temperature is 25°C ± 2°C

Note 1: Definition of Viewing Angle

Viewing angle is the angle at which the contrast ratio is greater than 10. The viewing angles are determined for the horizontal or the vertical clock direction with respect to the optical axis which is normal to the LCD surface

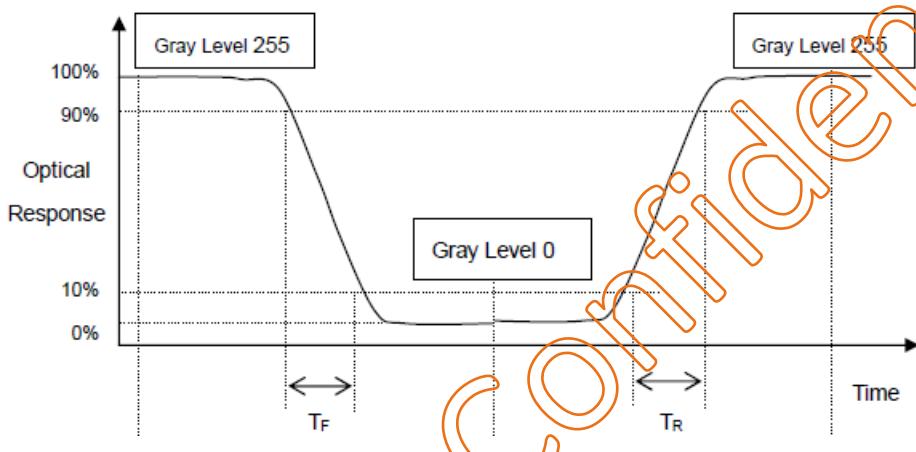

Note 2: Definition of Contrast Ratio (CR)

Measure the viewing angle of $\theta = 0$ and at the center of the LCD surface. Luminance with all pixels in white state divide by Luminance with all pixels in Black state

Note 3 Definition of Response Time:

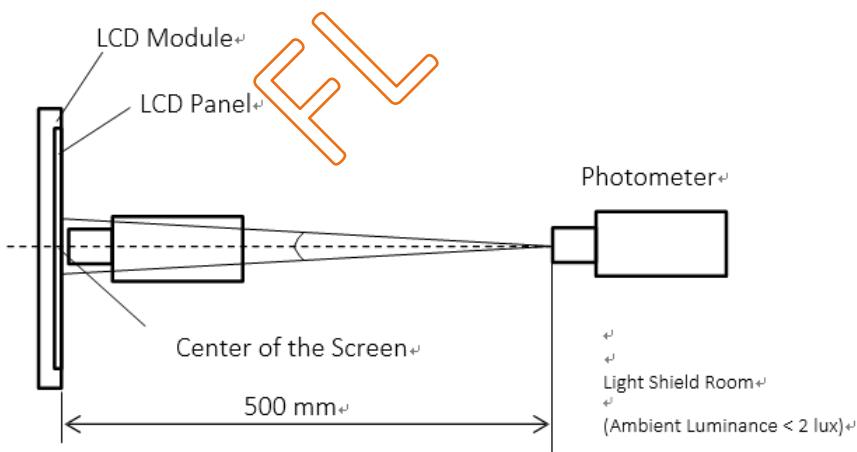

The response time is set initially by defining the “Rising Time (Tr)” and the “Falling Time (Tf)” respectively. The response time interval is between 10% and 90% of amplitudes, please refer the figure to the followings:

Note 4: Definition of Brightness (Lc)

Measure the center area of the panel and the viewing angle of the $\theta_x=\theta_y=0^\circ$

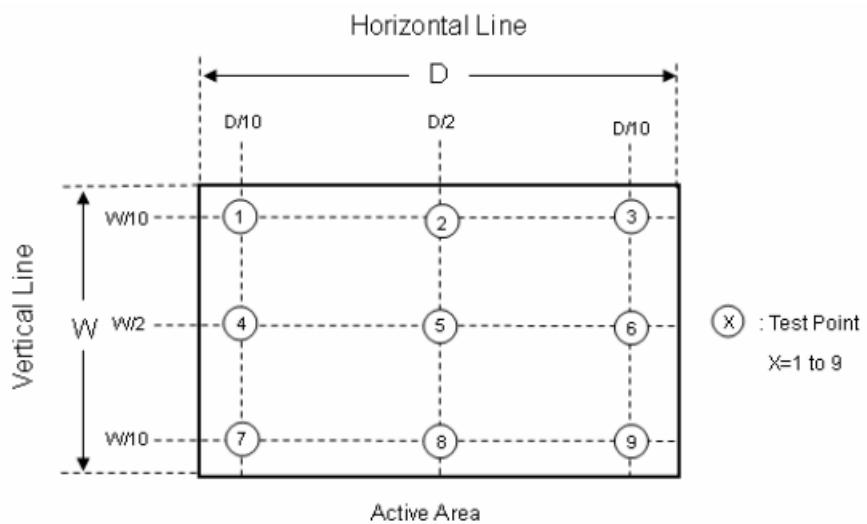

Note 5: The method of optical measurement:

Note 6: Definition of White Variation (δW):

Measure the luminance of gray level 255 at 9 points

$\delta W = \text{Maximum} [L(1), L(2), L(3) \dots L(8), L(9)] / \text{Minimum} [L(1), L(2), L(3) \dots L(4), L(5)]$

D. PRECAUTION AND PRODUCT HANDLING

- Do not apply the external force such as bending or twisting to the module during assembly.
- Do not insert and plug out the input connector while the LCD panel is operating.
- Do not take apart the panel or frame from module assembly or insert anything into the backlight unit.
- Do not keep the same pattern in a long period of time, it may cause image sticking on LCD panel. Can use shuffle content periodically if fixed pattern is displayed on the screen.
- Do not touch the display area with bare hands, this will stain the display area.
- Pay attention to handle lead wire of backlight, that is not tugged in connect with LED driver.
- Do not change variable resistance settings in LCD panel, it may cause not satisfy of LCD characteristics specification.
- To avoid the static electricity to damage the CMOS LSI, the operator should be grounded when in contact with the LCD panel, and also to all electrical equipment.
- Need to follow the correct power frequency when LCD panel is connecting and operating, this can avoid damage to CMOS LSI during latch-up.
- Need to store the LCD panel indoor without the exposure of sunlight where the temperature is $25^{\circ}\text{C} \pm 5^{\circ}\text{C}$ and the humidity is below 60% RH.
